fein

The memory layer for venture capital.

Warm introductions

Meeting prep

Deal memory

Answers in Claude and ChatGPT

the problem

Your team's memory is scattered across the tools it works in.

The real record of every relationship sits in inboxes, calendars, notes and the CRM. Each tool holds a piece, and no tool holds the picture.

The CRM shows one picture, the inbox another.

Coverage is a guess, because the system of record is the one nobody keeps up to date.

When a partner leaves, the memory leaves.

What they knew about a founder, an LP or a pass was never written anywhere.

Relationships go quiet in silence.

Nobody notices the drift until the next deal, or the next raise, goes somewhere warmer.

Deal history is not searchable.

The memo, the reason and the introduction sit in three systems and one person's memory.

what fein is

One context graph of every relationship your team has.

fein reads your team's email, calendar, notes and CRM. It resolves them into one live graph: who exists, who knows whom, and how well. Then it answers in Claude, ChatGPT and Cursor, and every answer carries its source document.

01

Reads

Your inbox, calendar, Drive, LinkedIn and CRM, read continuously. Your team logs nothing.

02

Resolves

Every duplicate contact becomes one identity, scored from real signals, not an LLM guess.

03

Answers

One MCP endpoint. The same cited answer in every AI tool your team already uses.

what you can ask

Four questions your team asks every week.

Who is the warmest path to this founder?

The weighted shortest path through your real graph, and the best colleague to make the introduction.

What should I know before this meeting?

The attendees, how you know each of them, and what was open, on your screen before the meeting starts.

Why did we pass on this company?

The meeting, the memo and the exact stated reason, each line traced to its source document.

Which relationships are going cold?

The ones drifting from their own learned rhythm, flagged from dates and intervals, not a guess.

your stack stays

It sits on top of the systems you run today.

fein works with 30 or more tools. It reads the CRM and everything around it, then resolves the whole picture into one graph. It replaces no system, migrates no data, and asks your team for no new data entry.

CRM and deals

DealCloud, Affinity, Salesforce, Attio, HubSpot, Airtable

Files, notes and chat

Drive, SharePoint, Dropbox, DocSend, Granola, Slack, Notion

Email and calendar

Gmail, Google Calendar, Outlook, Microsoft 365

Where it answers

Claude, ChatGPT, Gemini, Cursor, Perplexity, Copilot

Your data never leaves your servers.

Always self-hosted.

It runs on your infrastructure and sends nothing to us.
No telemetry, no control plane.

Private by person.

Each person's sensitive sources live in their own layer,
enforced inside every query.

Open source, end to end.

Every line that touches your data is public, Apache 2.0
licensed. Read it before you run it.

Every change written down.

Ingests, merges and decisions land in an append only
audit trail, with who made them.

managed setup

Live in 14 days. Your part is two short calls.

day 1

We connect your systems.

On the first call we connect email, calendar, Drive, LinkedIn and the CRM, on your own servers.

days 2 to 13

It reads your full history.

Years of email, meetings and documents, resolved into one record per person. Nobody maintains it by hand.

day 14

You check it, then it goes live.

On a second short call you check the answers against what you know. Then fein works like it has been there for years.

Setup and upkeep, never access. Never per seat.

option	price	what you get
Run it yourself	\$0 forever	The same code we deploy for clients, Apache 2.0. No paid tier of the software, no feature held back.
Managed	\$450 a month	A forward deployed engineer builds fein into your stack, then keeps it running. Live on day 14 with your full history read back. The build is included: nothing to pay up front.
One price, flat	\$450 at any size	No tier above or below it, and never per seat. Connectors kept working, new answers and new connectors on request, a named engineer. Month to month, no lock-in.

why it holds up

A graph your AI tools can trust, not a search box.

Deterministic

The same question gets the same answer every time, from structured graph traversal, not document scraping.

Cited

The document behind each line is one click away. Nothing has to be taken on faith.

Aware of time

A fact that stops being true is retired with its dates, not overwritten. You can ask what the team believed when it decided.

Yours

If you cancel, the software, the graph and every answer stay running on your servers.

next

See it answer a real question from a team's own history.
